

Pipe Design

Steven Bucksbaum February 6, 2011

Advantages: Should be faster to develop.

Disadvantages: Harder to maintain.

Any object has access to any other object in the application.

A 2-Tier Model

1. User Application
2. Data Provider

Heavy use of static methods. When a bug occurs, one is uncertain which calling function is the source of the problem. Making bug fixing more difficult.

Data Provider -

Any container of data including:

1. Databases
2. Web Services
3. Flat Files
4. Others

Databases –

SQL may be placed in stored procedures.
